Patient: 56 year-old male.

Past medical history:
- Hypertension, chronic obstructive pulmonary disease, diabetes, peripheral vascular disease, peripheral neuropathy, Charcot foot. Recurrent wound for the last 2 years. Current wound is six months old.

Previous treatment:
- Cellular tissue product, collagen with oxidized regenerated cellulose, debridement, and foam dressings were used for 21 weeks.
- Endoform dermal template, Hydrofera Blue classic foam used with an offloading diabetic shoe for 3 weeks. Despite advanced wound dressings and diabetic shoe, wound did not progress.

Wound treatment:
- Began wound management with FastCast OLS system and Endoform dermal template and covered with Hydrofera Blue Ready foam, which was secured with tape.
- Offloaded with FastCast OLS system.
- Changed weekly for a total of 8 applications.

Without proper pressure relief, successful healing will be unlikely even when using advanced therapeutics. The addition of the FastCast OLS system, which includes Endoform dermal template and Hydrofera Blue Ready foam dressings, helped the wound get back on a healing trajectory.
